

# OpenSCENARIO usage example

Emil Knabe & Dr. Mikael Andersson  
Volvo Cars

# Agenda

- Basic simulation use cases
- Controllers
- Advanced use case: Driver model interaction
- Q&A

All examples run in esmini, an open source OpenSCENARIO player

<https://github.com/esmini/esmini>

# Basic simulation use cases

## 1. Open loop – all behavior defined by the scenario alone

- No feedback from driver or active system
- Useful for generating synthetic sensor data
- Also OK for testing correct triggering of functionality
- Example:

Forward collision warning

# Basic simulation use cases

## 2. Closed loop – behavior affected by external control

- Feedback from driver or active system  
(driver can be a real human or a driver model)
- Example: Emergency Brake  
(active system in the loop)

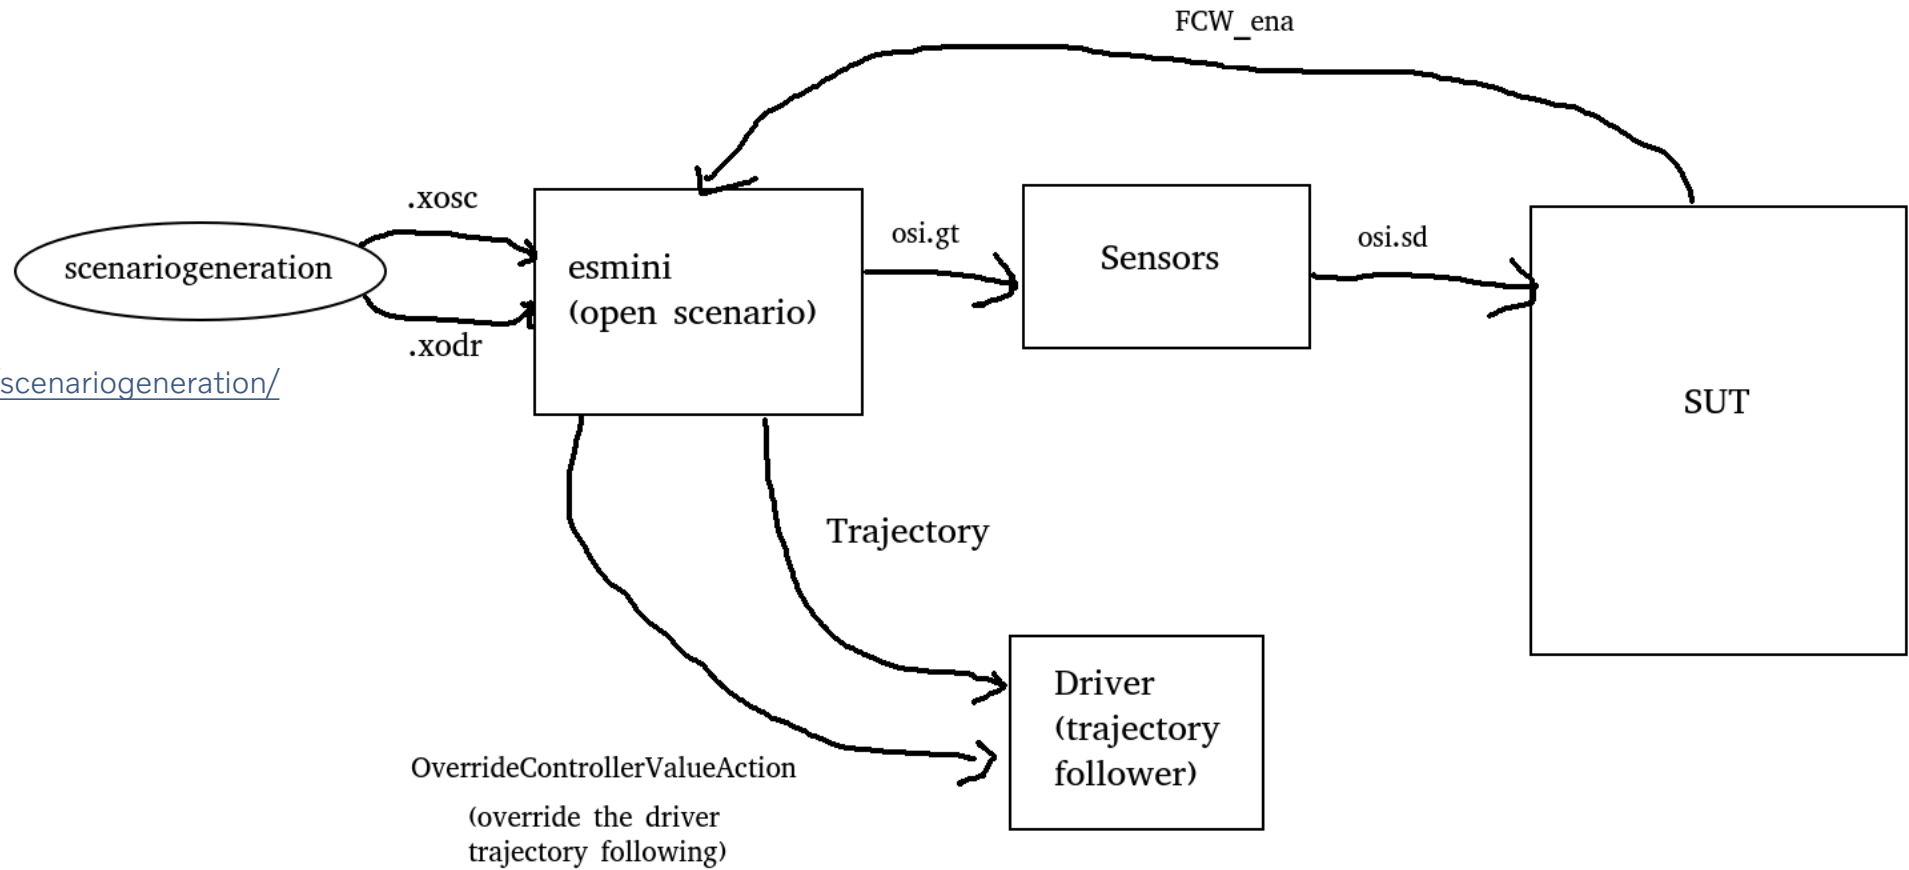

# Controllers

- The concept provides a way to hand over control of entities
- esmini has a few built-in controllers, e.g:
  - ExternalControl (report state via API or UDP)
  - InteractiveDriver (use keyboard arrow keys)
- Scenarios can be adaptive using relative actions and conditions
- Simple example:
  - Cut-in with and without interactive controller

the lane change and brake actions are triggered based on Time Headway

# Simulation flow

# EuroNCAP scenario example

## 8.2.3 Car-to-Car Rear stationary

The CCRs scenario is a combination of speed and overlap with 5km/h incremental steps in speed and 25% in overlap within the ranges as shown in the tables below.

Figure 8-1: CCRs scenario

	AEB + FCW combined		AEB only	FCW only
	AEB	FCW		
<b>AEB CCRs</b>	10-50 km/h -50%-50%	30-80 km/h -50%-50%	10-80 km/h -50%-50%	30-80 km/h -50%-50%

ESS tests will only be allowed for the -50% overlap situation (in case of LHD).
