<b><u>5</u></b>	<b><u>MDF General Block Format</u></b>	<b><u>17</u></b>
5.1	Overview of Block Types Used	17
5.2	Definition of Data Types Used And Mapping to ASAM Data Types	19
5.3	General Block Setup	20
5.3.1	Header section	20
5.3.2	Link section	20
5.3.3	Data section	21
5.3.4	Description of Members	21
5.4	General Rules	22
5.4.1	String Encoding, Byte Order and Alignment	22
5.4.2	Naming Rules	23
5.4.3	Identification of Channels	23
5.4.4	Linking of Blocks	27
5.4.5	Synchronization Domains	30
5.5	The File Identification Block IDBLOCK	32
5.5.1	Block Structure of IDBLOCK	32
5.5.2	Unfinalized MDF	33
5.6	The Header Block HDBLOCK	37
5.6.1	Block Structure of HDBLOCK	37
5.6.2	Contents of the Meta Data Block for the Header Comment	39
5.7	The Meta Data Block MDBLOCK	41
5.7.1	Block Structure of MDBLOCK	41
5.8	The Text Block TXBLOCK	42
5.8.1	Block Structure of TXBLOCK	42
5.9	The File History Block FHBLOCK	43
5.9.1	Block Structure of FHBLOCK	43

5.9.2	Contents of the Meta Data Block for the File History Comment	44
<b>5.10</b>	<b>The Channel Hierarchy Block CHBLOCK</b>	<b>45</b>
5.10.1	Block Structure of CHBLOCK	45
5.10.2	Contents of the Meta Data Block for the Hierarchy Comment	48
<b>5.11</b>	<b>The Attachment Block ATBLOCK</b>	<b>49</b>
5.11.1	Block Structure of ATBLOCK	49
5.11.2	Contents of the Meta Data Block for the Attachment Comment	51
<b>5.12</b>	<b>The Event Block EVBLOCK</b>	<b>51</b>
5.12.1	Block structure of EVBLOCK	52
5.12.2	Common Use Cases for Events	59
5.12.3	Example For Events	60
5.12.4	Contents of the Meta Data Block for the Event Comment	62
<b>5.13</b>	<b>The Data Group Block DGBLOCK</b>	<b>62</b>
5.13.1	Block Structure of DGBLOCK	63
5.13.2	Contents of the Meta Data Block for the Data Group Comment	63
<b>5.14</b>	<b>The Channel Group Block CGBLOCK</b>	<b>64</b>
5.14.1	Block Structure of CGBLOCK	64
5.14.2	Contents of the Meta Data Block for the Channel Group Comment	67
5.14.3	Variable Length Signal Data (VLSD) CGBLOCK	67
5.14.4	Example using a VLSD CGBLOCK	68
<b>5.15</b>	<b>The Source Information Block SIBLOCK</b>	<b>70</b>
5.15.1	Block Structure of SIBLOCK	71
5.15.2	Contents of the Meta Data Block for the Source Comment	72
<b>5.16</b>	<b>The Channel Block CNBLOCK</b>	<b>73</b>
5.16.1	Block Structure of CNBLOCK	73
5.16.2	Data Structure for Channel Data Type "CANopen Date"	84
5.16.3	Data Structure for Channel Data Type "CANopen Time"	84
5.16.4	Contents of the Meta Data Block for the Channel Comment	85
5.16.5	Contents of the Meta Data Block for the Channel Unit	87
<b>5.17</b>	<b>The Channel Conversion Block CCBLOCK</b>	<b>88</b>
5.17.1	Block Structure of CCBLOCK	88
5.17.2	CCBLOCK – 1:1 Conversion	91
5.17.3	CCBLOCK – Linear Conversion	92
5.17.4	CCBLOCK - Rational conversion	92
5.17.5	CCBLOCK –Algebraic Conversion (MCD-2 MC Text formula)	93
5.17.6	CCBLOCK – Value to Value Table With Interpolation	93
5.17.7	CCBLOCK – Value to Value Table Without Interpolation	94
5.17.8	CCBLOCK – Value Range to Value Table	95
5.17.9	CCBLOCK – Value to Text / Scale Conversion Table	96
5.17.10	CCBLOCK – Value Range to Text / Scale Conversion Table	97
5.17.11	CCBLOCK – Text To Value Table	99
5.17.12	CCBLOCK – Text To Text Table	100
5.17.13	Contents of the Meta Data Block for the Conversion Comment	101
5.17.14	Contents of the Meta Data Block for the Conversion Unit	102
<b>5.18</b>	<b>Composition of Channels</b>	<b>102</b>
5.18.1	Structures	102
5.18.2	Arrays	105

# 1 FOREWORD

MDF stands for Measurement Data Format. It is a binary file format to store measured or calculated data for post-measurement processing or long-term conservation. Common sources of the data to be stored are sensors, ECUs or bus monitoring systems. In addition to the plain measurement data, MDF also contains descriptive and customizable meta data within the same file.

The format is organized in loosely coupled binary blocks to ensure high performance reading and writing. The measurement data is stored channel-oriented and organized in records. MDF supports non-equidistant sampling rates and multiple rates per file. Master channels are used for synchronization which can be time, angle, distance or simply index related.

MDF allows storage of raw measurement values and corresponding conversion formulas. It supports special data types and information particularly required in the automotive area, and is closely related to other ASAM standards, e.g. ASAM MCD-2 MC (ASAP2).

The format definition is published in the base standard which describes the following content:

- Version history
- Version handling and compatibility rules
- MDF block structure
- General rules
- List of all binary block types and their contents
- MDF meta data format (XML)

The description how to store information for certain use cases is published in different associated standards. Such use cases are:

- **Naming of Channels and Channel Groups** [[MDF-NC](#)]  
This associated standard describes how to set the different names for channels and channel groups for common use cases in order to provide important information to the user and to achieve a unique identification of the channels.
- **Bus Logging** [[MDF-BL](#)]  
This associated standard describes how to store the traffic of common bus systems.
- **Measurement Environment** [[MDF-ME](#)]  
This associated standard describes how to store information about the measurement environment.

Binary example MDF files are contained in the deliverable of the respective standard or may be requested from the ASAM COMMON MDF working group ([mdf@asam.net](mailto:mdf@asam.net)).
