Mixed-Reality

Idea and Concept (Visualization)

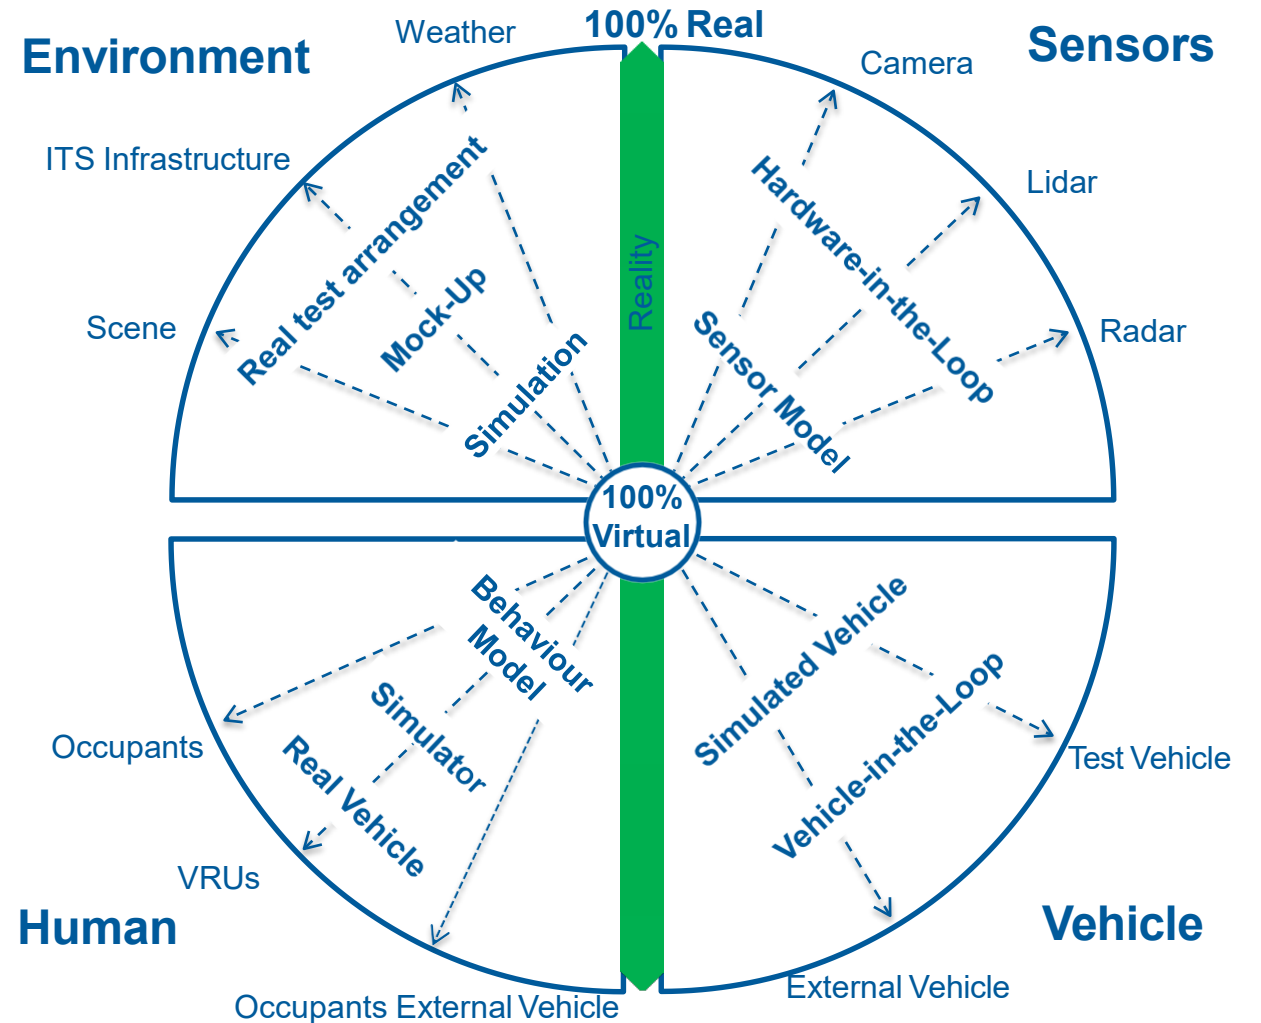

Mixed-Reality

Idea and Concept

Scaling reality to have an optimal test environment for your system to test

- Reducing reality at axes, where it is **not needed**
- Reducing reality at axes, where it is **too dangerous** (e.g., vulnerable road users in emergency situations)

Mixed-Reality

Use-Case and First Approach

Mixed-Reality

Real Implementation and Extended Approach

Mixed-Reality and OSI

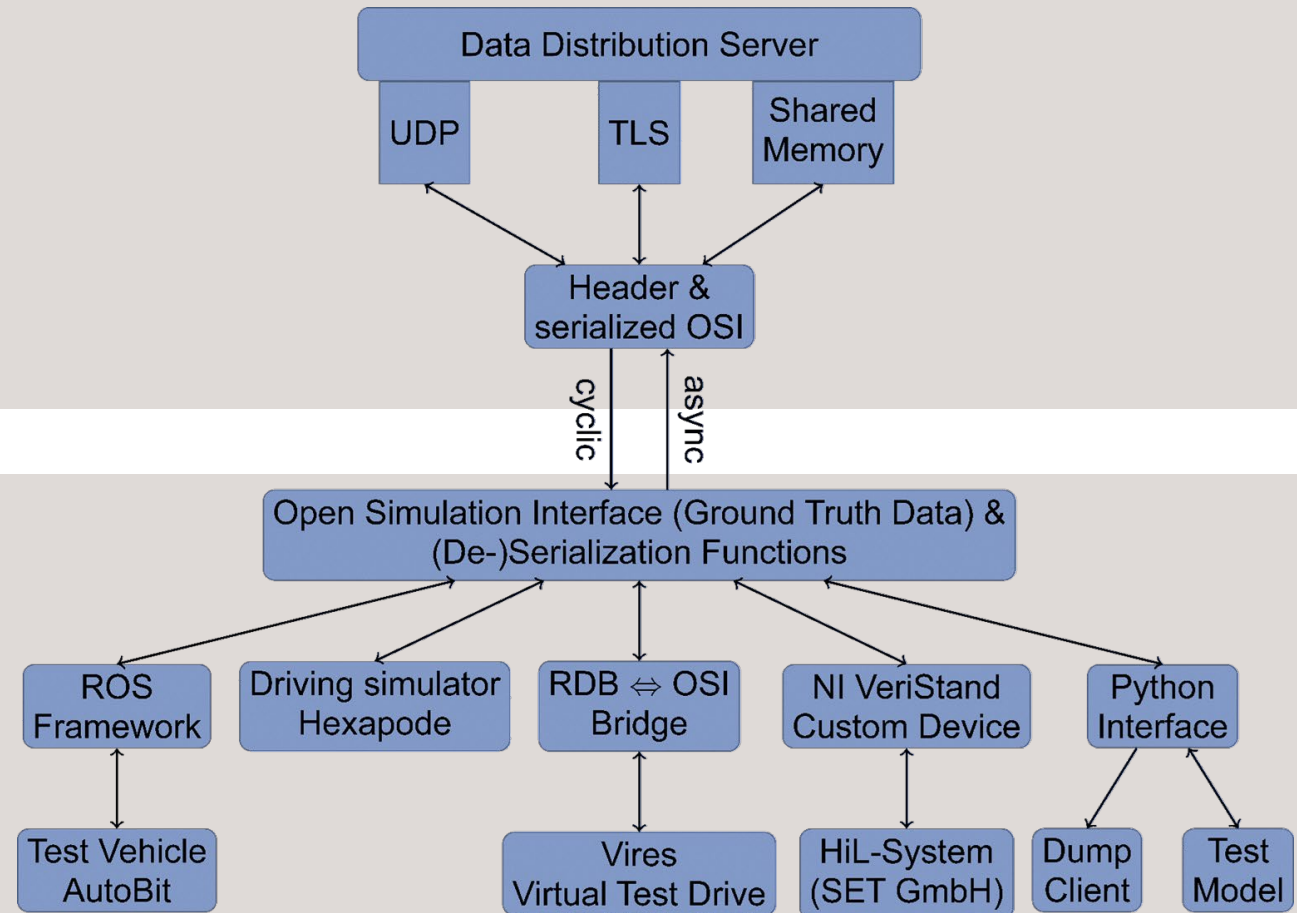

OSI as an enabler

- **Centralized server** exchanges Data between OSI-agents
- **OSI – GroundTruth** message as basic supported data type

→ Exchanges everything that can be seen from “god view”

- **Single agents** e.g., Vehicles, Pedestrian, cyclists, etc.
- Containing **component models**, e.g., behavior models, sensor models, etc.

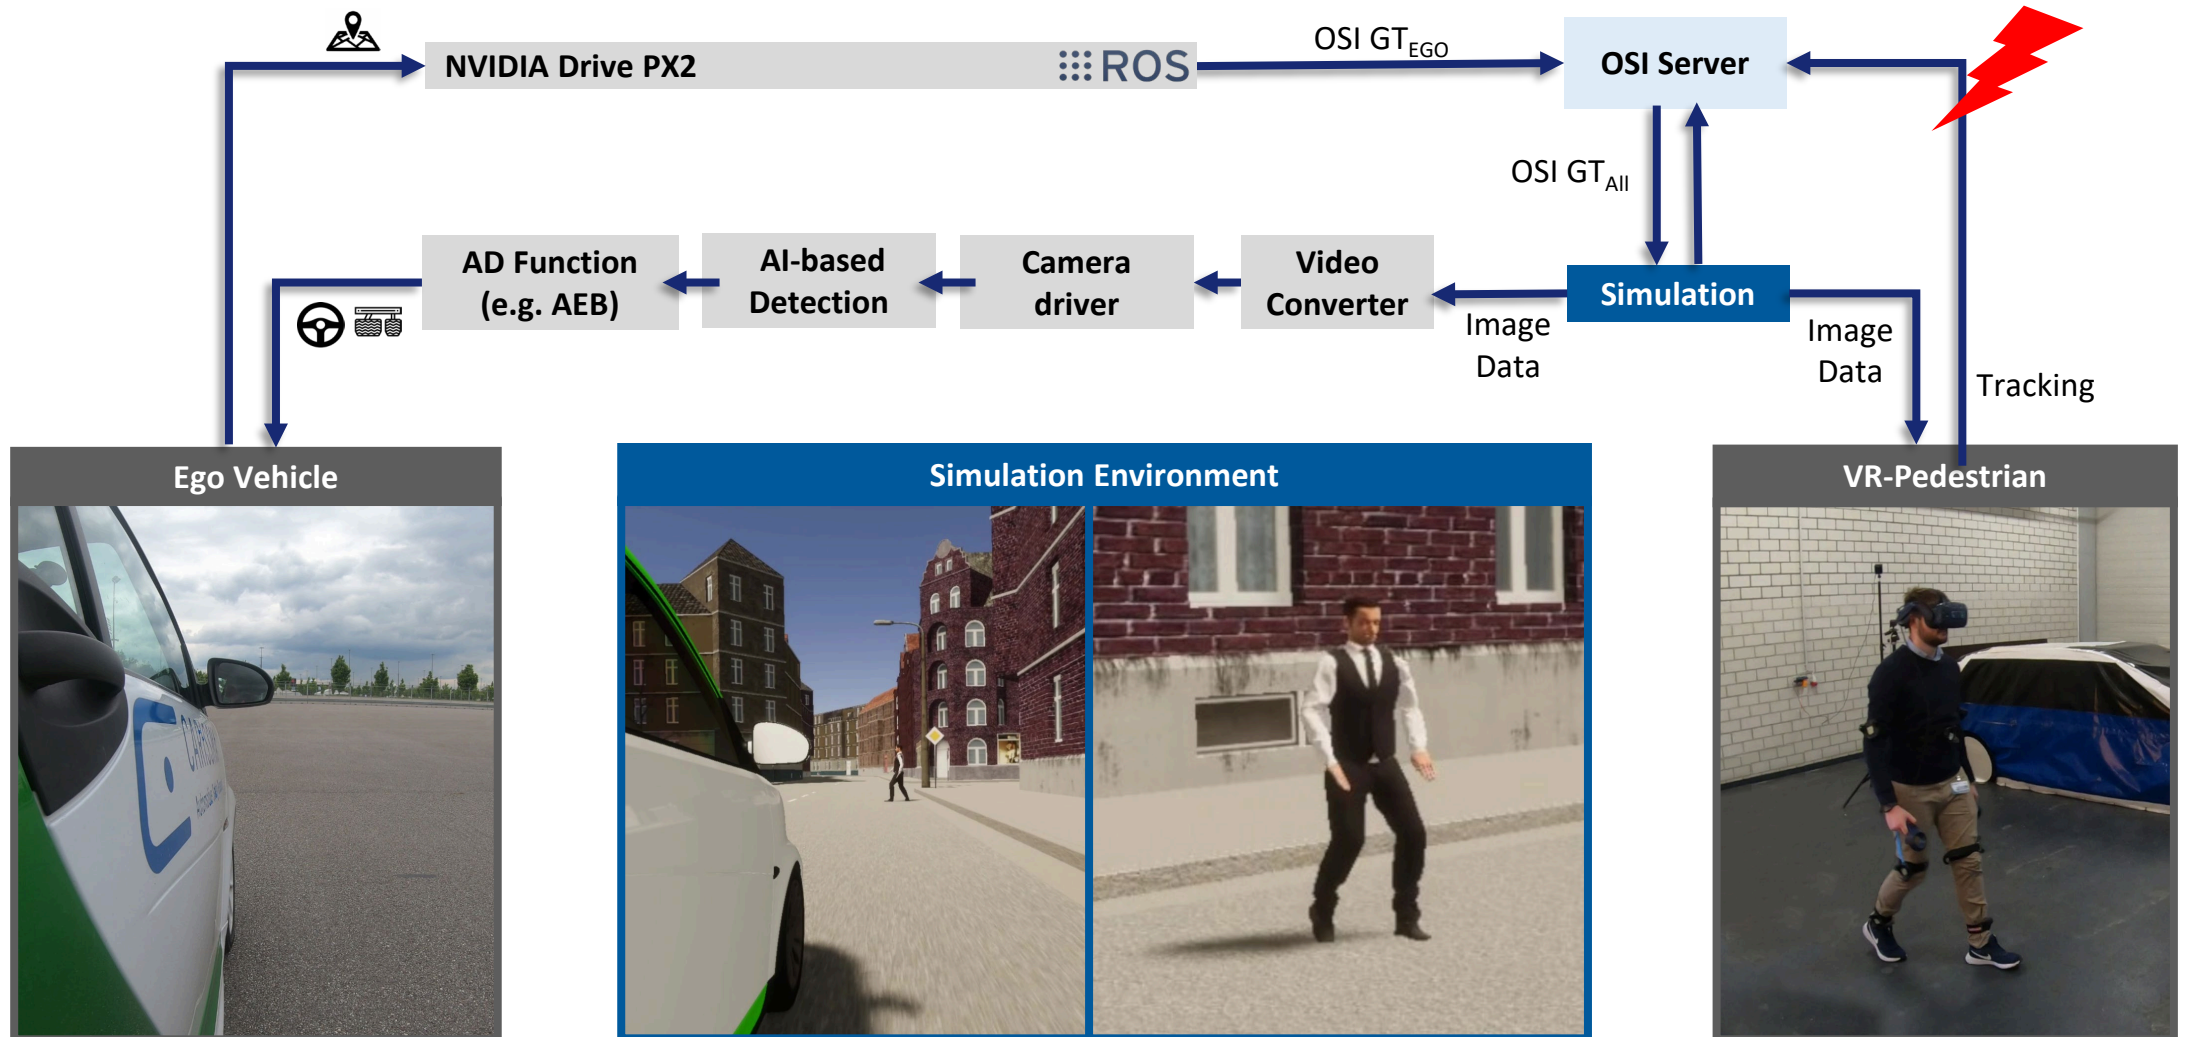

→ Contains all information and behavior of one agent within the test environment

Mixed-Reality and OSI

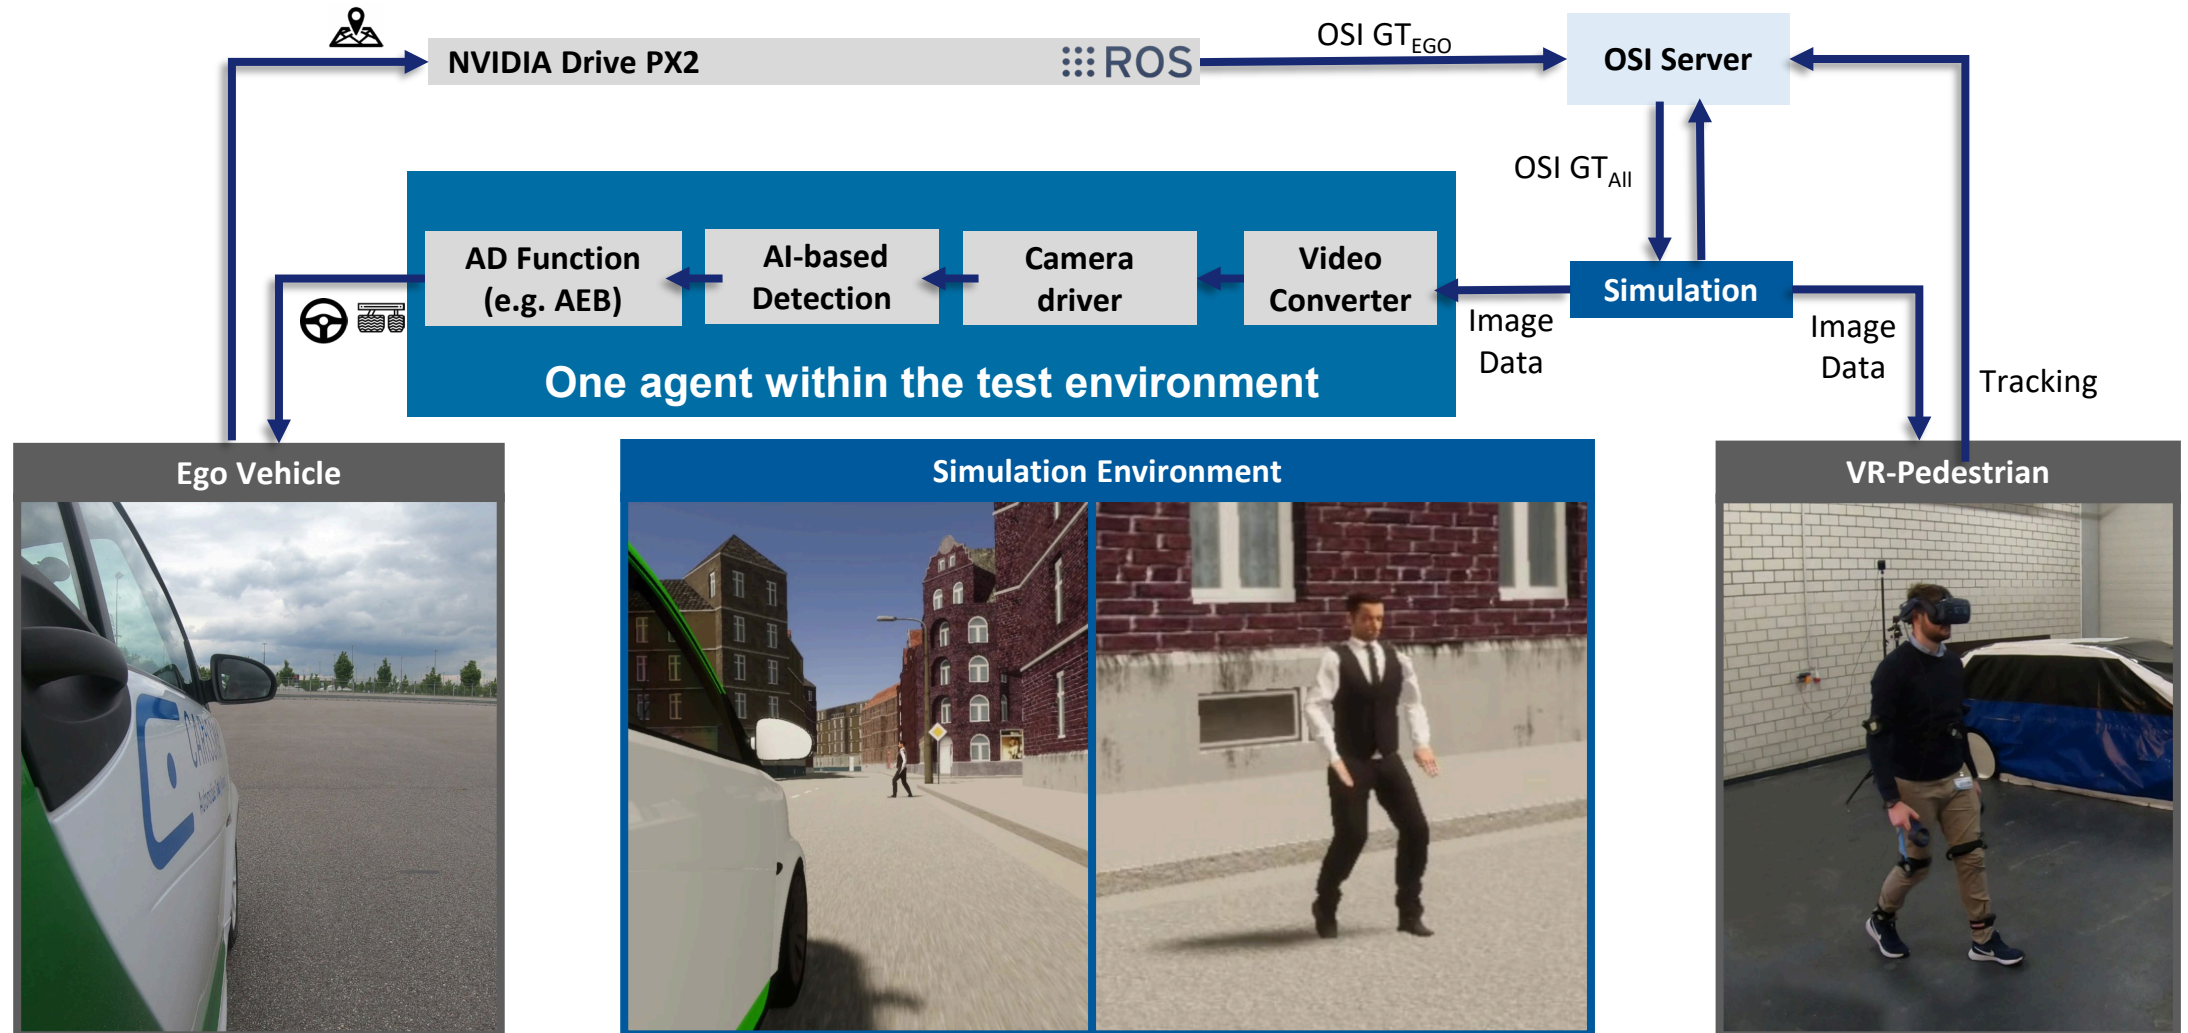

OSI as an exchange format between agents

A pedestrian model is work in progress

Mixed-Reality and OSI

OSI as an exchange format between agents?

Mixed-Reality and OSI

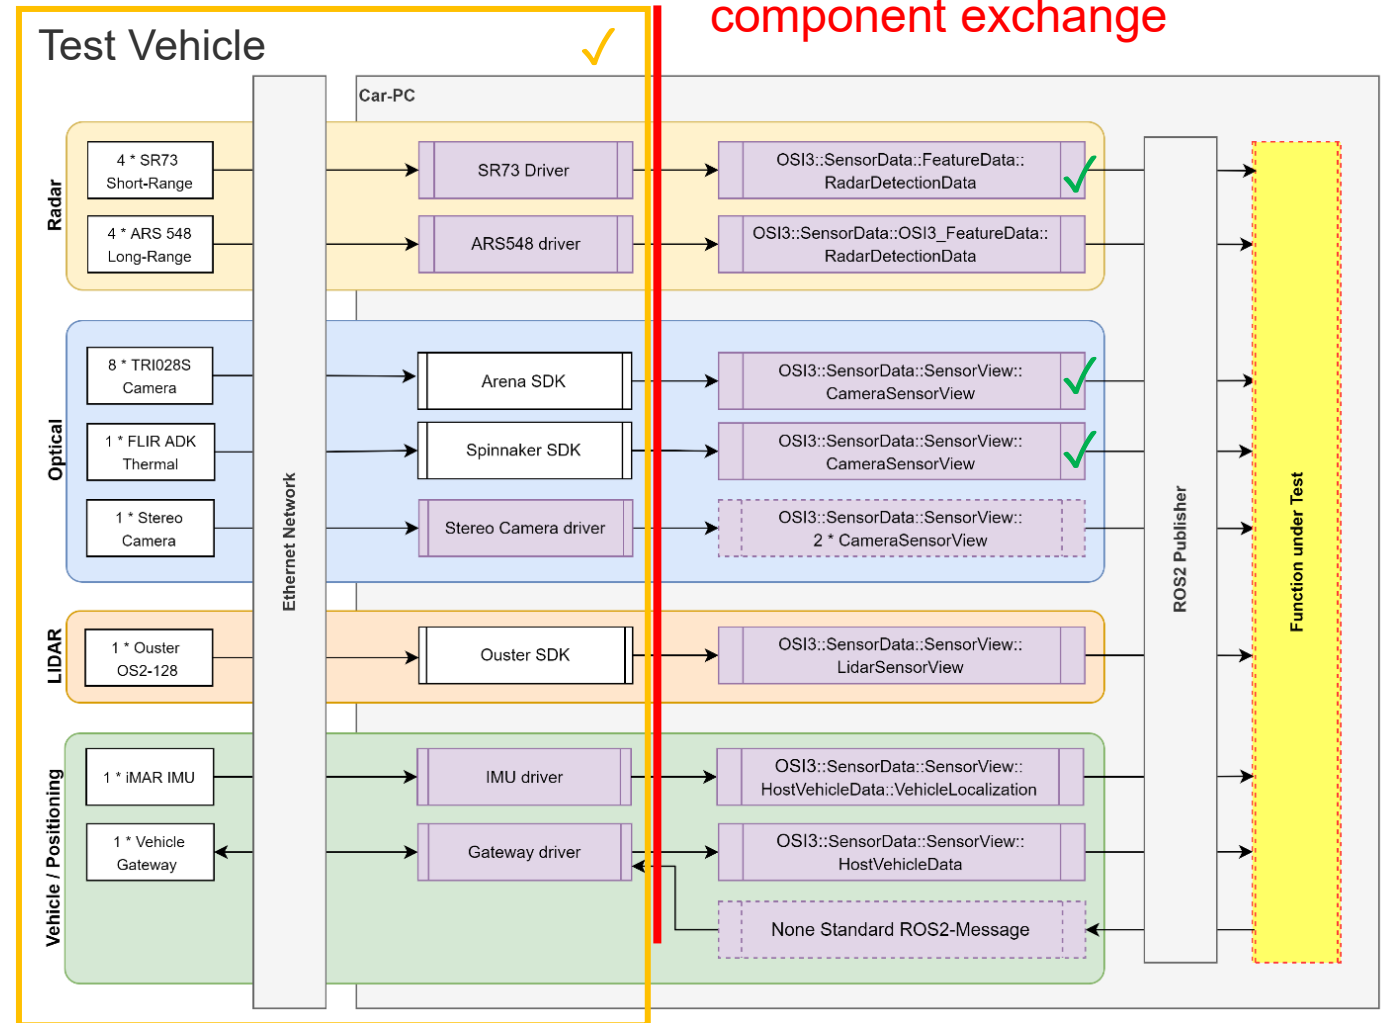

OSI as an exchange format between components **within** agents.

A real test vehicle as an OSI agent

- Every internal vehicle components can be exchanged with virtual components
- Flexible data routing through ethernet based communication

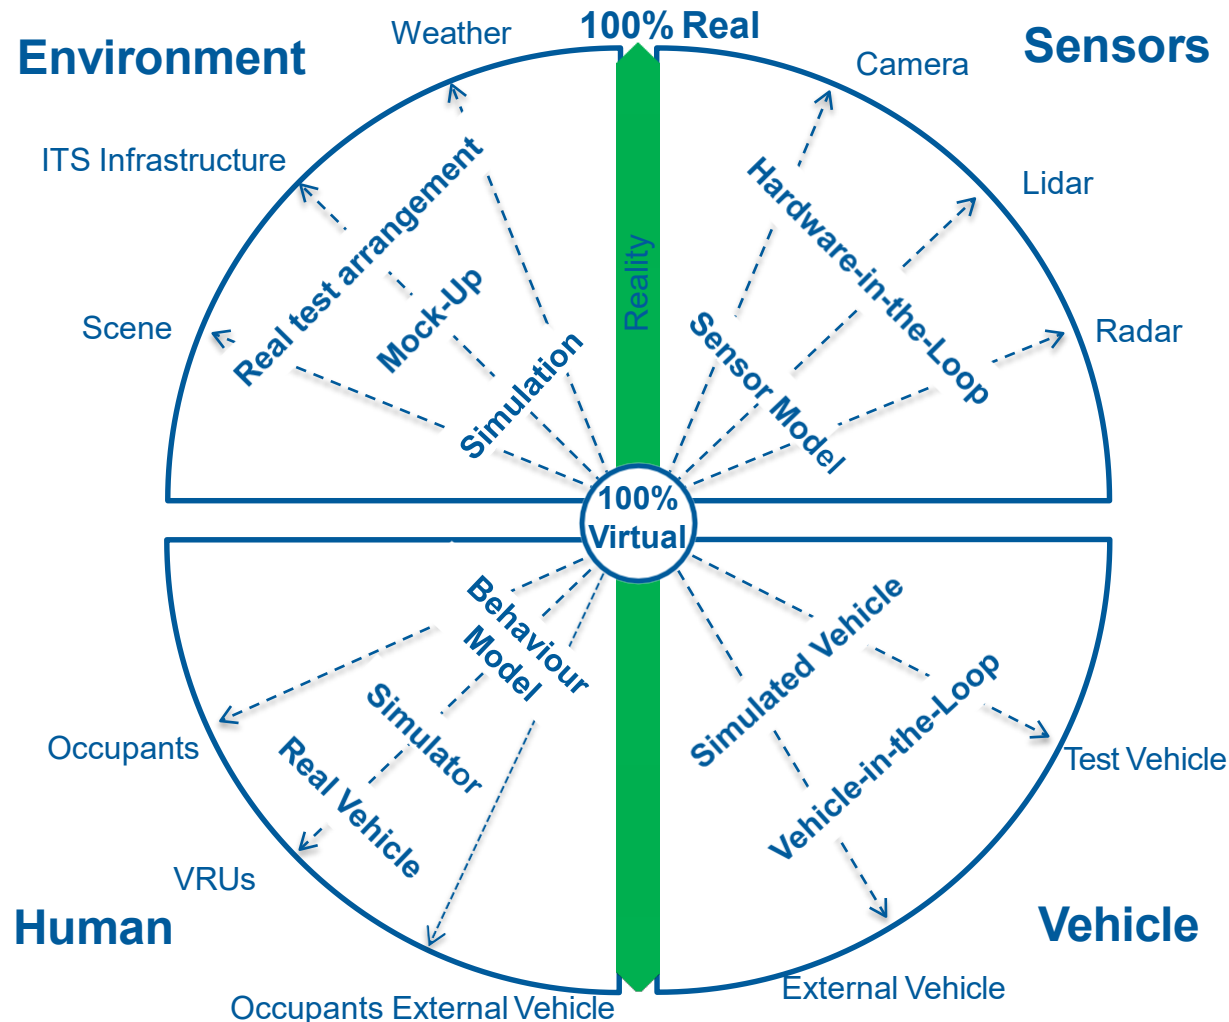

→ Work in progress

OSI enables flexible
component exchange

Mixed-Reality and OSI

Summary

The **Open Simulation Interface** is the core communication protocol between and within real and simulated components in our Mixed-Reality environment.

Thank you for your attention!
