Requirements on a standardized test specification

Concept Project ASAM OpenTestSpecification

Requirements on a standardized test specification

- The ASAM Test Specification Study Group Report provided a comprehensive set of use-cases for test specifications

- The Concept Project ASAM OpenTestSpecification extended this list and created an overview of related standards

- For the combined set of 19 use-cases, the project identified 16 general, overarching requirements

- The requirements were harmonized based on the usage of a common terminology and further concretized to 16 sets of concrete requirements

- Modal verbs were applied to each requirement specification to state requirement bindingness

- Result is a requirements document to serve as foundation for the evaluation of existing test specifications and their potential for standardization
